BOTCHED ($BOTCHED)

White Paper · Version 1.1 · October 6, 2026

EXECUTIVE SUMMARY

BOTCHED ($BOTCHED) is a community token born on Solana through a fair launch on Pump.fun. Holder rewards are paid every week in wXRP directly on Solana. In an optional second phase, the token may also extend to the XRP Ledger (XRPL) through a cross-chain bridge. The goal is to connect two communities: Solana's launch speed and liquidity, and the XRP payments network and ecosystem.

Total supply is fixed at 1,000,000,000 tokens, with no presale, no private allocations and no ability to mint new tokens. Once the bridge is live, the combined supply across both chains stays exactly the same: every token on the XRPL is backed 1:1 by a token locked on Solana.

Holders can receive XRP, paid as wXRP on Solana, through a rewards program funded by a share of the fees the project earns. Anyone can also win wXRP in community contests, and a monthly sweepstakes with a $5,000 prize is open to holders and free entrants alike. This document describes the token, its launch mechanism, the rewards program, the bridge architecture, the roadmap and the risks. Rewards depend entirely on fees actually received; no specific return is promised.

INTRODUCTION: SOLANA, THE XRP LEDGER AND THE OPPORTUNITY

Today crypto communities are split by chain: a token created on Solana does not move on the XRP Ledger, and vice versa. BOTCHED aims to close that gap with a token that lives on both.

Solana offers fast, low-cost transactions, and platforms like Pump.fun allow a fair, transparent launch without raising capital upfront or seeding liquidity by hand.

The XRP Ledger is one of the longest-running production blockchains, built for payments, with settlement in seconds, minimal fees, a built-in decentralized exchange and native AMM pools. Its community is large and very active.

The opportunity: launch on Solana to take advantage of its easy launch process, then bring the token to the XRPL to reach its community, its native DEX and its payment use cases.

VISION AND MISSION

Vision: to be the bridge token between the Solana and XRP communities, proving that a community project can live on more than one chain without losing transparency.

Mission:

- Launch with the same rules for everyone: no presale, no private lists, no hidden tokens.
- Build an active community on both chains.
- Optionally extend the token to the XRP Ledger through a secure, verifiable bridge.
- Publish every relevant step (addresses, transactions, audits) so anyone can check it.

Identity: BOTCHED's face is an original character: a clumsy little robot that gets everything wrong but always gets back up. The name plays on "BOT" and on the idea that something went sideways. The project is not linked to any real person or news event.

THE TOKEN: TECHNICAL SPECIFICATIONS

Parameter	Phase 1 (Solana)	Phase 2 (XRP Ledger)
Name	BOTCHED	BOTCHED
Ticker	$BOTCHED	BOTCHED (XRPL currency code)
Standard	Solana SPL token	Issued token with trust lines
Total supply	1,000,000,000	Part of the same supply, backed 1:1
Decimals	6	XRPL native precision
New token minting	Disabled (mint authority revoked)	Only by the bridge, against tokens locked on Solana
Contract address	[Posted at launch]	[Posted when the bridge goes live]

On the XRPL, anyone who wants to hold $BOTCHED must set a trust line to its issuing account, which will be Axelar's XRPL gateway. The exact token details will be published only on the project's verified channels.

FAIR LAUNCH ON PUMP.FUN

$BOTCHED will launch on Pump.fun under the platform's standard rules, which are the same for every participant:

1. **Creation:** the token is created with a fixed supply of 1,000,000,000 and no ability to mint more.

2. **Bonding curve:** the price rises automatically as tokens are bought. There is no presale and no special price for anyone.
3. **Graduation:** when the curve completes, the platform automatically migrates liquidity to a decentralized exchange, where the token keeps trading freely.
4. **Liquidity:** liquidity is handled by the platform during migration, which reduces the risk of the team pulling it.

Team purchase: the creator buys publicly at launch, from the wallet that creates the token. The team's total holdings will never exceed 10% of the supply. See Team Wallets for how these tokens are held.

TEAM WALLETS

The team's tokens are held in six public wallets, each with a defined purpose. All addresses are published on the official website and in this document.

Wallet	Purpose	Address
Founder	Creator's holding	`9gzwR3RB7ywD2ym4Ho39hpnNKbCWP7rCKnnjzG7yRQbK`
Team	Core contributors	`8PVVFySQnFuryt88rSyQwBU8vBNjKJUaSJbKZyZsqZSA`
Marketing	Promotion and partnerships with creators	`4TYQgmH6kRxH33h3ALmjMTgmSC6c5N7JXhvRn2j61LiC`
Contests	$BOTCHED prizes for community contests	`9aoFo6Rb7QoD8qt5Skx9fSsSxA4nBFEgii9En466P7LG`
Partnerships	Listings and ecosystem partners	`2Etc1zh5D9UwPUnmhdrEqo5VotiLvvTFHyeXNv4NERQh`
Reserve	Liquidity needs and unforeseen costs	`FZLgAcFjazjC1m3YMtrxCrcemo8XLKbw6Jq3conqfTDY`

Project wallets (no team tokens; they receive the creator fees):

Wallet	Purpose	Address
Rewards	Receives 50% of creator fees and pays the weekly wXRP rewards	`bMkK9ym7eiSoV5Z3FR48pt2iZuRjt2YxxBYMY23PwDz`
Development	Receives the other 50%: development, audits, contests and the Big Prize	`9TUNfu9Ty6jihxD6hLvxo1GrrjuZQnTAu2kB1mqiWdLN`

Rules for team wallets:

- Combined, they never hold more than 10% of the total supply.
- They are excluded from every holder rewards snapshot and never receive wXRP rewards.
- They do not vote in community polls, so governance stays in the hands of the community.

- Team tokens are not locked. The team may sell, for example to cover liquidity needs. Every movement is visible on-chain, and the team will post significant sales on the official channels.
- No other wallet controlled by the team holds $BOTCHED. Any new team wallet will be added to this list before it is used. The Founder wallet is the wallet that creates the token on Pump.fun. Two more project wallets hold no team tokens and are also published: the Rewards wallet (receives 50% of creator fees and pays wXRP rewards) and the Development wallet (receives the other 50%).

TOKENOMICS

100% of the supply reaches the market through the Pump.fun curve and its liquidity migration: no tokens are reserved for the team, private investors or marketing beyond what is bought publicly.

Item	Detail
Total supply	1,000,000,000 $BOTCHED (fixed)
Presale / private round	None
Team allocation	No tokens reserved; public purchase at launch, max 10% held in 6 published wallets
Transaction tax	0%
Inflation	None
Supply on the XRPL (Phase 2)	Variable, always equal to what is locked in the bridge

Cross-chain supply rule: tokens on Solana + tokens on the XRPL = 1,000,000,000. The bridge can never create tokens that are not locked on the other side.

Development funds: creator fees offered by the platform are split 50/50, on-chain, between the holder rewards wallet and the development wallet, which funds the bridge, security audits, contests and the monthly sweepstakes (see Holder Rewards). Public donations go to the development wallet. All use of funds is visible on-chain in the public Development wallet (see Team Wallets).

PHASE 2 (OPTIONAL): BRIDGE TO THE XRP LEDGER

This phase is not needed for holder rewards, which are already paid in wXRP on Solana; it would let $BOTCHED also trade on the XRP Ledger. The bridge will use a lock-and-mint model: tokens are locked on Solana and the same amount is issued on the XRPL; on the way back, they are burned on the XRPL and released on Solana.

From Solana to the XRPL:

1. The user sets a trust line in their XRPL wallet for $BOTCHED, issued through Axelar's XRPL gateway.
2. They send their $BOTCHED to the bridge contract on Solana, which locks them.
3. The bridge verifies the lock and delivers the same amount to the user's XRPL address.

From the XRPL to Solana:

1. The user sends their $BOTCHED back through the Axelar gateway on the XRPL, which removes them from circulation there.
2. The bridge verifies the transaction and releases the same amount on Solana.

Choosing the provider: the project plans to use Axelar's Interchain Token Service, an existing, audited interoperability network that connects Solana and the XRP Ledger mainnet and supports custom tokens, instead of building a bridge from scratch. Building a custom bridge is expensive, and bridges have historically been one of the most attacked points in crypto. The integration will be tested on testnet before any mainnet use.

Liquidity on the XRPL: once the bridge is live, a native XRPL AMM pool will be created for the $BOTCHED/XRP pair so the token can be swapped directly against XRP.

HOLDER REWARDS (WXRP)

$BOTCHED holders can receive XRP, paid as wXRP directly to the same Solana wallet that holds their $BOTCHED. Part of the fees the project earns is converted to wXRP and distributed to holders in proportion to their holdings. Amounts depend entirely on the fees actually received, so they rise and fall with trading activity and may be zero in some periods.

What is wXRP. wXRP is wrapped XRP on Solana, issued by the regulated custodian Hex Trust and bridged with LayerZero. Each wXRP is backed 1:1 by native XRP held in custody and can be redeemed for native XRP on the XRP Ledger. It is supported by common Solana wallets and apps such as Phantom and Jupiter.

Funding. 50% of the creator fees received from Pump.fun go to a dedicated rewards wallet, and 50% go to the development wallet, which funds development, audits and contests. The split is set on-chain with Pump.fun's creator fee sharing configuration, so anyone can verify it. Fees in the rewards wallet are converted to wXRP before each distribution.

How to receive wXRP. Nothing to register: rewards are sent automatically to the Solana wallet holding $BOTCHED. If the XRPL bridge goes live in Phase 2, holders of $BOTCHED on the XRPL will receive native XRP on the XRPL instead.

How it works.

1. Rewards are paid **every week**. The first payout takes place 7 days after launch.
2. Each week, 2 snapshots of all balances are taken at random times that are not announced. A holder's share is based on their average balance across both snapshots, which rewards holding through the week rather than buying just before a snapshot.
3. Wallets with an average balance below **500,000 $BOTCHED** (0.05% of supply) are not included. The community may vote to lower this minimum if the token price rises significantly.
4. Excluded from every snapshot: the Pump.fun bonding curve and liquidity pool accounts, bridge accounts, exchange wallets, the 6 team wallets, and the Rewards and Development wallets.
5. Every recipient address is screened against international sanctions lists before payment; listed addresses are excluded.
6. The wXRP in the rewards wallet is sent pro rata to eligible holders' Solana wallets. If a holder's share for the week is worth less than $1, it is carried over and added to their next payout, so network fees never exceed the reward.
7. The full list of transactions is published after every payout.

If trading volume drops and weekly amounts become very small, the community may vote to move to a two-week period.

Transparency. For each period, the project publishes the fees received, the wXRP distributed, the snapshot times (after the fact), the eligibility list and the transaction hashes.

No guaranteed return. Rewards are a share of fees that may or may not exist. There is no fixed or minimum amount, and the program may change, pause or end, including for legal or regulatory reasons. Recipients are responsible for their own taxes.

COMMUNITY CONTESTS (WXRP PRIZES)

On top of holder rewards, the project runs regular contests with wXRP prizes: meme and art contests, challenges, governance polls and bridge testing campaigns. Contests are open to everyone: entry never requires buying or holding $BOTCHED, and every contest offers a free way to enter. Winners are chosen by published rules (skill-based judging or community vote), prizes are fixed amounts announced in advance, and winners' addresses are screened against sanctions lists before payment.

MONTHLY BIG PRIZE SWEEPSTAKES

Once a month, the project may run a sweepstakes with one big prize: **$5,000 in wXRP**. The prize is fixed in U.S. dollars and paid in wXRP at the market rate on the payment date, so its value is always exactly $5,000.

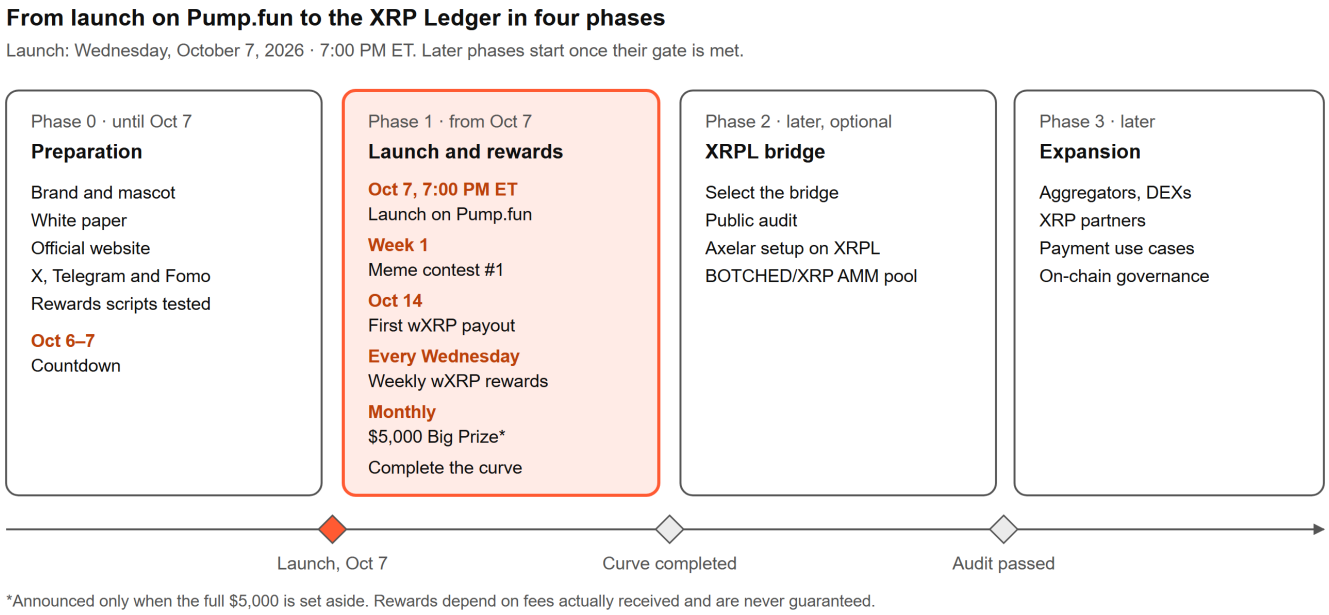

No purchase necessary. Holders with an average balance of 500,000 $BOTCHED or more in the sweepstakes snapshot are entered automatically. Anyone else can enter for free, once per sweepstakes, through the entry form on the official website. Every entry has exactly the same chance of winning, whether it comes from holding or from the free form.

How it works.

1. A sweepstakes is announced only when the full $5,000 is already set aside in the public Development wallet; the reserved amount is published with each announcement. If funds are not available, there is no sweepstakes that month.
2. Each sweepstakes publishes its official rules in advance: entry period, snapshot date, prize, eligibility, how the winner is drawn and excluded jurisdictions.
3. Participants must be 18 or older. Team wallets, project wallets and their owners cannot win. Void where prohibited.
4. The winner is drawn with verifiable on-chain randomness, and the draw transaction is published.
5. The winner's address is screened against sanctions lists before payment. Winners in the United States must provide tax information, since prizes of $600 or more are reported to the IRS.
6. If the winner does not claim the prize within the period stated in the rules, an alternate winner is drawn.

Prize cap. The total prize value of each sweepstakes never exceeds $5,000, which keeps it within the threshold that triggers additional registration requirements in some U.S. states, such as Florida and New York. [Rules to be reviewed by legal counsel before the first sweepstakes.]

ROADMAP

$BOTCHED launches on Pump.fun on Wednesday, October 7, 2026, at 7:00 PM ET. The first wXRP payout follows on Wednesday, October 14, and payouts continue every Wednesday after that. The first meme contest runs during launch week. The $5,000 Big Prize runs monthly, announced only once the full prize is set aside.

The XRPL bridge goes live only once the Pump.fun curve has completed and the chosen bridge has passed a public audit; dates will be announced on the official channels.

COMMUNITY AND GOVERNANCE

BOTCHED is a community-driven project. Major decisions, such as the bridge provider or the use of treasury funds, will go to public consultation before they are carried out.

- **Official channels:** website, X (Twitter) and Telegram. [Links posted at launch.]
- **Voting:** public polls on the official channels during Phase 1; on-chain token-weighted voting to be evaluated later.
- **Ambassadors:** community members who represent the project in the Solana and XRP ecosystems.

SECURITY AND TRANSPARENCY

- **No additional minting:** the token's mint authority on Solana is revoked at creation.

- **Public wallets:** all 8 project wallets (6 team wallets, Rewards and Development) will be published.
- **Bridge audit:** the chosen bridge must have public security audits before it goes live.
- **Proof of reserves:** a public link will let anyone verify that tokens on the XRPL match the tokens locked on Solana.
- **Official addresses:** only those published on the official website are valid. Any other contract or issuing account with the same name is an imitation.

RISKS

Buying $BOTCHED carries significant risk. Anyone should consider the following before taking part:

- **Volatility:** community token prices can rise or fall extremely within minutes, including losing almost all of their value.
- **Bridge risk:** cross-chain bridges can fail or be attacked; a failure could affect tokens circulating on the XRPL. Rewards are paid in wXRP, which depends on the custodian Hex Trust and on LayerZero; a failure of either could affect the value or redeemability of wXRP already received.
- **Platform risk:** the project depends on Pump.fun, Solana, the XRP Ledger and the bridge provider, none of which the team controls.
- **Regulatory risk:** crypto laws change and vary by country; they could restrict the use or trading of the token. Because holders receive a share of project fees, regulators in some countries, including the United States, may treat $BOTCHED as a security, which could force the rewards program or the token to change or stop.
- **Execution:** Phase 2 depends on technical and funding factors; it could be delayed or not completed. Separately, the team may hold up to 10% of the supply without a lock-up and may sell at any time, which could put pressure on the price.
- **Imitations:** fake tokens with the same name may appear. Always verify the official addresses.

LEGAL NOTICE

This document is for informational purposes only. It is not an offer to sell, a solicitation to invest, or financial, legal or tax advice.

$BOTCHED gives no equity in any company and no promise of future value. Holder rewards are a discretionary share of fees actually received, with no guaranteed amount, and may change or end at any time. The token's price depends on market supply and demand.

The roadmap reflects current intentions and may change. Each person is responsible for complying with the laws of their country before acquiring or using the token. Only participate with funds you can afford to lose.
